DESCRIPTION

AMINE DERIVATIVES

TECHNICAL FIELD

The present invention relates to novel amine derivatives. In further detail, the present invention relates to a compound which has a somatostatin receptor binding inhibition activity, and is useful for preventing and/or treating diseases associated with somatostatin.

BACKGROUND ART

Somatostatin was found to be a growth hormone inhibiting factor (somatotropin release inhibiting factor; SRIF) in 1973.

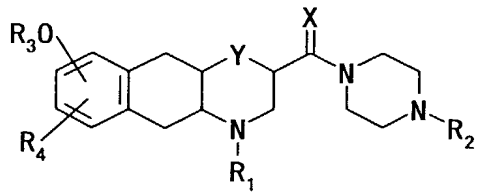
Somatostatin receptors were found to comprise five subtypes that have been named as SSTR1, SSTR2, SSTR3, SSTR4 and SSTR5 respectively (e.g., Endocrinology, vol.136, pp.3695-3697, 1995; Trends in Pharmacological Sciences, pp.87-94, Vol.18, 1997; Life Science, Vol.57, pp.1249-1265, 1995).

Somatostatin is known to inhibit production and/or secretion of various hormones, growth factors, and physiologically active substances. As the hormones inhibited by somatostatin, mentioned are growth hormone (GH), thyroid-stimulating hormones (TSH), prolactin, insulin, and glucagon. Therefore, somatostatin has various functions in endocrine systems, exocrine systems and nerve systems, and drugs targeting somatostatin are being developed (e.g., Endocrinology, vol.136, p.3695-3697, 1995; Trends in Pharmacological Sciences, pp.87-94, vol.18, 1997).

Diseases caused by somatostatin include life-style related diseases such as diabetes; central nervous system diseases, immune system diseases, and hormone-

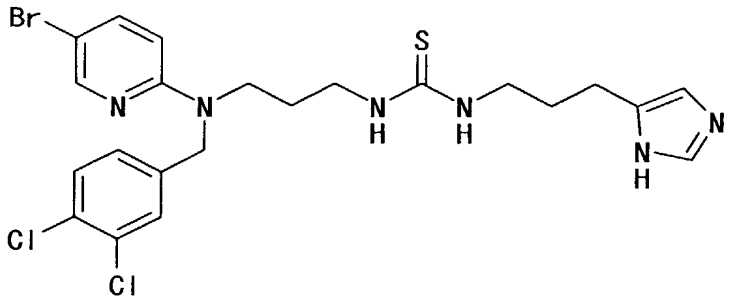
dependent tumors. Trials to develop somatostatin itself or somatostatin analogues as a drug have been conducted. For instance, octreotide known as a somatostatin receptor agonist has been marketed as a drug for treating hormone-dependent tumors.

As a compound having a somatostatin receptor binding activity, especially a selective SSTR1 antagonist activity, there is known a compound represented by the formula:



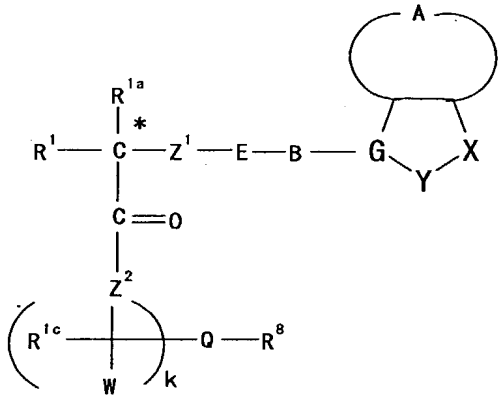
wherein X represents O or H, H; Y represents $-CH_2-$, $-O-$, $-NH-$ or $-S-$; R_1 represents H or C_{1-4} alkyl; R_2 represents H, benzyl, etc.; R_3 represents H, C_{1-4} alkyl, etc.; and R_4 represents hydrogen atom or halogen (WO97/03054).

As a compound which has a selective SSTR4 binding activity and is expected to have a glaucoma treating activity, there is known a compound represented by the formula:

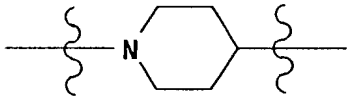


(J. Am. Chem. Soc., vol.120, pp.1368-1373, 1998; WO97/43278).

As a compound having a somatostatin receptor binding activity, especially a selective SSTR2 agonist activity, a compound represented by the formula:



wherein R^1 represents C_{1-10}alkyl, etc.; R^{1a} represents H, etc.; Z^1 represents -O-, etc.; E represents $-SO_2-$, etc.; B represents



etc.;

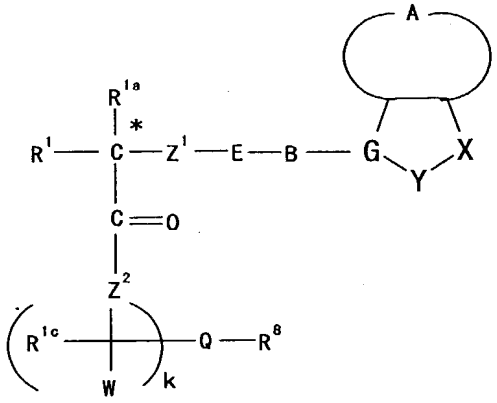
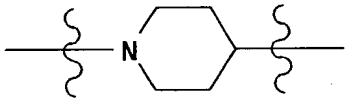
represents 5- to 10-membered condensed aryl, etc.; Z^2 represents -O-, etc.; R^{1c} represents H, etc.; W represents H, etc.; k represents 0 or 1; Q represents $-(CH_2)_x-V-(CH_2)_y-$ (x and y each represent 0, 1, 2, 3, 4, 5 or 6; V represents 6- to 12-membered aromatic monocyclic or bi-cyclic ring), etc.; and R^8 represents H, etc.

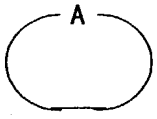
(WO98/44921); and a compound represented by the formula:



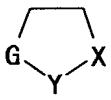
wherein R^1 represents C_{1-10} alkyl, etc.; R^{1a} represents H, etc.; Z^1 represents -O-, etc., E represents $-SO_2-$, etc.; B represents



etc.,



represents 5- or 6-membered aromatic or non-aromatic ring; G represents N, CH or C; Y represents -C(O)-, etc.; X represents $-N(R^{11})-$ (R^{11} represents H, etc.), etc.;

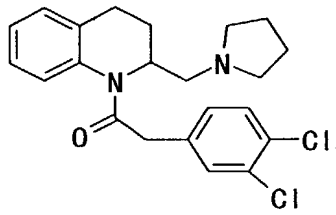


represents 5- to 10-membered condensed aryl, etc.; Z^2 represents -O-, etc.; R^{1c} represents H, etc.; W represents H, etc.; k represents 0 or 1; Q represents $-(CH_2)_x-V-(CH_2)_y-$ (x and y each represent 0, 1, 2, 3, 4, 5 or 6; V represents C_{3-10} saturated or partially saturated aromatic monocyclic or bi-cyclic ring containing 1 to 4 nitrogen atoms and 0 to 2 oxygen atoms or sulfur atoms),

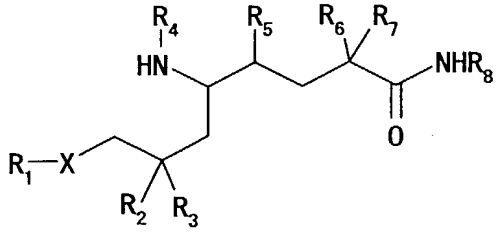
etc.; and R^8 represents H, etc.; (WO98/45285).

On the other hand, the following compounds are known as amine derivatives.

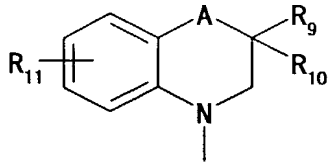
1) J. Med. Chem., vol.34, pp.2624-2633, 1991 describes, as a compound having a weak analgesic activity, a compound represented by the following formula:



2) JP-A-8-176087 describes 3-(N,N-dimethylaminomethyl)-1,2,3,4-tetrahydroquinoline as a synthetic intermediate for a compound represented by the formula:



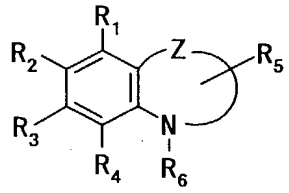
wherein R_1 represents arylamino such as



(A represents a direct bond, methylene, ethylene, imino, oxy or thio; R_9 represents C_{1-4} alkoxycarbonylamino-C_{1-4} alkyl, etc.; R_{10} represents hydrogen or C_{1-4} alkyl; R_{11} represents hydrogen or halogen; etc.); X represents carbonyl, etc.; R_2 and R_3 represent hydrogen, etc.; R_5 represents hydroxyl, etc.; R_6 represents hydrogen, etc.; R_7 represents hydrogen,

etc.; R_8 represents aliphatic group, etc., which is described to be useful in the treatment of hypertension.

3) WO97/12860 describes, as a compound having an acyl-coenzyme A: cholesterol acyltransferase inhibiting activity and a lipid peroxidation inhibiting activity, a heterocyclic derivative represented by the formula:



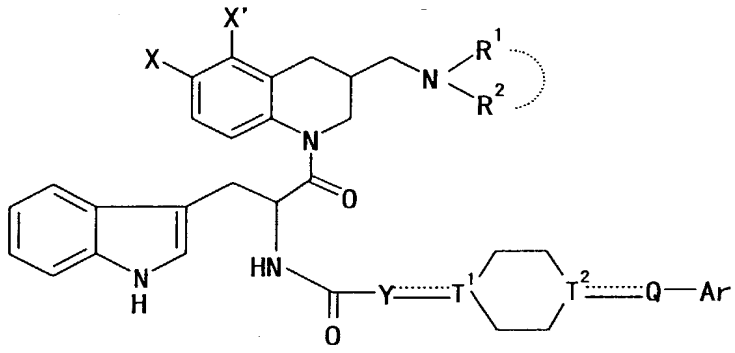
wherein at least one of R_1, R_2 and R_5 represents alkyl or alkenyl which is substituted by hydroxy, an acidic group, alkoxycarbonyl or $-NR_9R_{10}$ (R_9 and R_{10} each represent hydrogen atom or lower alkyl), etc., and the remaining two groups independently represent hydrogen atom, lower alkyl or lower alkoxy; either R_2 or R_5 represents a group represented by the formula: $-NHCOR_7$ wherein R_7 represents alkyl, etc., and the remaining group represents hydrogen atom, lower alkyl or lower alkoxy; R_6 represents alkyl, alkenyl, alkoxyalkyl, alkylthioalkyl, cycloalkyl, cycloalkylalkyl or arylalkyl; Z represents nitrogen atom substituted by R_6, or a linker group forming 5-membered ring or 6-membered ring together with a carbon atom of benzene ring attached to the nitrogen atom and a carbon atom adjacent to the carbon atom, or a pharmaceutically acceptable salt thereof.

Conventional somatostatin and its analogues are all peptides. They are problematic in their oral absorbability, pharmacokinetics, etc. and are therefore unsatisfactory as medicines. It is desired to develop a compound which is different from conventional known compounds in its chemical structure, and which has a

selective or nonselective affinity to somatostatin receptor subtypes, or an excellent somatostatin receptor binding inhibitory activity, etc., and which has satisfactory properties as a medicine.

DISCLOSURE OF INVENTION

The present inventors have studied various compounds having a somatostatin receptor binding inhibitory activity, and, as a result, have found, for the first time, that a compound of the formula:



(I)

Compound (I) can be isolated and purified by any known procedures, for example, through solvent extraction, pH adjustment, redistribution, crystallization, recrystallization, chromatography, etc. The starting compounds for compound (I) and their salts can be also isolated and purified according to the same known procedures as above, but without any isolation procedure, they may be used in the next step while they are in reaction mixtures.

Compound (I') or (I'') of the present invention can be produced according to the same method as that of the above-mentioned Compound (I).

The compound of the present invention may also be in the form of hydrates or non-hydrates thereof.

Where compound (I) includes optical isomers, stereo isomers, regio isomers and rotational isomers, those are within the scope of compound (I), and can be isolated as their single compound through *per se* known synthesis or separation. For example, where optical isomers of compound (I) exist, those resolved from their mixtures through optical resolution are within the scope of compound (I).

The optical isomers can be produced by *per se* known methods. Concretely, optically active synthetic intermediates or mixtures of racemate of the final product are subjected to ordinary optical resolution to give the corresponding optical isomers.

For the optical resolution, employable are *per se* known methods, such as a fractional recrystallization

method, a chiral column method, a diastereomer method, etc.

1) Fractional Recrystallization Method

The method which comprises allowing a racemate to react with an optically active compound (e.g., (+)-mandelic acid, (-)-mandelic acid, (+)-tartaric acid, (-)-tartaric acid, (+)-1-phenethylamine, (-)-1-phenethylamine, cinchonine, (-)-cinchonidine, brucine, etc.) to give a salt, which is then isolated through fractional recrystallization method, followed by, when desired, subjecting the isolated compound to neutralization to obtain free optical isomers.

2) Chiral Column Method

The method of separating a racemate or a salt thereof, which comprises utilizing a column for fractionating optical isomers (chiral column). In the case of liquid column chromatography, for example, a mixture of optical isomers is applied to a chiral column, such as ENANTIO-OVM (manufactured by Tosoh Corp.), CHIRAL SERIES (manufactured by Daicel Co.), etc., which is then eluted with water, various buffers (e.g., phosphate buffer) and organic solvents (e.g., ethanol, methanol, isopropanol, acetonitrile, trifluoroacetic acid, diethylamine, etc.), singly or as a suitable mixture of them, to isolate the individual optical isomers. In the case of gas chromatography, for example, a chiral column such as CP-Chirasil-DeX CB (manufactured by GL Science Co.), etc. is used for isolation.

3) Diastereomer Method

A racemic mixture is chemically reacted with an optically-active reagent to give a mixture of diastereomer, which is subjected to ordinary separation means (e.g., fractional recrystallization,

chromatography, etc.) to give single compounds. The thus-isolated single compounds are then chemically processed, for example, through hydrolysis to thereby remove the optically-active reagent site from the compounds to obtain optical isomers. For example, where compound (I) has a hydroxy group or a primary or secondary amino group in the molecule, it is condensed with an optically-active organic acid (e.g., MTPA [α-methoxy-α-(trifluoromethyl)phenyl-acetic acid], (-)-menthoxyacetic acid, etc.) or the like to give the corresponding ester-type or amide-type diastereomer. On the other hand, where compound (I) has a carboxylic acid group, it is condensed with an optically-active amine or alcohol reagent to give the corresponding amide-type or ester-type diastereomer. The thus-isolated diastereomer is then subjected to acidic or basic hydrolysis, through which it is converted into the optical isomer of the original compound.

Compound (I) has an optical active center at 2-position in 3-(indol-3-yl)propanoyl group or(and) 3-position in 1,2,3,4-tetrahydroquinolin-1-yl. And in said optical active center, there exist (R)-isomer and (S)-isomer. Among those, preferred is Compound (I') or Compound (I'') of (R)-isomer.

Experimental Example 1

The followings are some examples of the pharmacological actions of the compounds of the present invention, which should not be construed as being limiting to them. The gene manipulation using *E. coli* was conducted in accordance with the method described in the 1989 Edition of Molecular Cloning.

(1) Cloning of human somatostatin receptor protein subtype 4 (hSSTR4) DNA

DNA oligomers S4-1 and S4-2 were synthesized based on the known human SSTR4 DNA sequence (Rohrer etal., Proc. Natl, Acad. Sci., USA 90, 4196-4200, 1993). The sequence of S4-1 is 5'-GGCTCGAGTCACCATGAGCGCCCCCTCG-3' (Sequence No. 1) and that of S4-2 is 5'-GGGCTCGAGCTCCTCAGAAGGTGGTGG-3' (Sequence No. 2).

Human chromosomal DNA (Clonetech Inc. Catalog No. CL6550-1) was used as the template. To 0.5 ng of said DNA was added 25 pmol of each of the above-mentioned DNA oligomers and the polymerase chain reaction was carried out using 2.5 units of PfuDNA polymerase (Strata gene). The composition of the reaction mixture was in accordance with the directions attached to said Pfu DNA polymerase.

The conditions of the reaction were as follows: One cycle consisting of the reactions at 94°C for 1 minute, at 66°C for 1 minute and at 75°C for 2 minutes, and 35 cycles were repeated. The reaction mixture was subjected to electrophoresis on 1% agarose gel to find that the DNA fragments of the intended size (about 1.2 kb) were specifically amplified. Said DNA fragments were recovered from the agarose gel in the usual manner and ligated to pUC118 cleaved at the Hinc II site to transform into the competent cells, *Escherichia coli*

JM109. The transformant having plasmid containing said DNA fragments was selected out and the sequence of the inserted DNA fragments was confirmed by the automatic sequence analyzer employing fluorochroming, ALF DNA Sequencer (Pharmacia). As the results, the amino acid sequence expected from the nucleotide sequence was completely in agreement with the sequence described in the above-mentioned reports by Rohrer et al.

(2) Construction of the expression plasmid of human somatostatin receptor protein subtype 4 (hSSTR4) DNA

pAKKO-111 was used as the expression vector in CHO (Chinese Hamster Ovary) cells. pAKKO-111 was constructed as follows: The 1.4 kb DNA fragment containing SRα promoter and poly A appositional signal was obtained from pTB1417 described in JP-A-H5(1993)-076385 by the treatment with a restriction enzyme (Hind III) and a restriction enzyme (Cla I). On the other hand, the 4.5 kb DNA fragment containing dihydrofolic acid reductase gene (dhfr) was obtained from pTB348 [Naruo, K. et al., Biochem. Biophys. Res. Commun., 128, 256-264, 1985] by the treatment with a restriction enzyme (Cla I) and a restriction enzyme (Sal I). These DNA fragments were treated with T4 polymerase to make the terminal blunt-ended and ligated with T4 ligase to construct pAKKO-111 plasmid.

Then, 5 μg of the plasmid having human SSTR4 DNA fragment was digested with a restriction enzyme (XhoI) and subjected to electrophoresis on 1% agarose gel to recover the 1.2 kb DNA fragment encoding human SSTR4. Next, 1 μg of the above-mentioned expression vector pAKKO-111 (5.5 kb) was digested with Sal I to prepare the cloning site for insertion of human SSTR4 DNA fragment. Said expression vector fragment and the 1.2 kb

DNA fragment were ligated with T4DNA ligase. The reaction mixture was introduced into *E. coli* JM 109 by the calcium chloride method to obtain the expression plasmid pA1-11-hSSTR4 in which human SSTR4 DNA fragment was inserted in regular direction against the promoter from the transformants. This transformant is expressed as *Escherichia coli* JM109/pA-1-11-hSSTR4.

(3) Transfection and expression of human somatostatin receptor protein subtype 4 (hSSTR4) DNA in CHO ($dhfr^-$) cells

1×10^6 CHO ($dhfr^-$) cells were cultured for 24 hours in HAM F12 medium containing 10% bovine fetal serum on a laboratory dish of 8 cm in diameter. The cells were transfected by 10 μg of the human SSTR4 DNA expression plasmid, pA-1-11-hSSTR4 obtained above using the calcium phosphate method (Cell Phect Transfection Kit; Pharmacia). The medium was switched to Dulbecco's Modified Eagle Medium (DMEM) containing 10% dialyzed bovine fetal serum 24 hours after the transfection to select the colony-forming cells (i.e. $dhfr^+$ cells) in this medium. Further, the selected cells were cloned from a single cell by the limiting dilution method and the somatostatin receptor protein expression activity of these cells was measured as follows: Human SSTR4 receptor expression cell strain was diluted with a buffer solution for assay [50 mM of Tris hydrochloride, 1 mM of EDTA, 5 mM of magnesium chloride, 0.1% of BSA, 0.2 mg/ml of bacitracin, 10 μg/ml of leupeptin, 1 μg/ml of pepstatin and 200 units/ml of aprotinin (pH 7.5)] to adjust the cell number to 2×10^4/200 μl. 200 μl of the dilution was placed in a tube and to this was added 2 μl of 5 nM [^{125}I]-somatostatin-14 (2000 Ci/mmol, Amersham). The mixture was incubated at 25°C for 60 minutes. For

measurement of non-specific binding (NSB), the tube to which 2 μl of somatostatin-14 (10^{-4} M) was added was also incubated. To the tube was added 1.5 ml of a buffer solution for washing [50 mM of Tris-hydrochloride, 1 mM of EDTA and 5 mM of magnesium chloride (pH 7.5)] and the mixture was filtered by GF/F glass fiber filter paper (Whatman) and washed further with 1.5 ml of the same buffer solution. The amount of [^{125}I] of the filter was measured by a γ-counter. Thus, a highly somatostatin-binding cell strain, hSSTR4-1-2, was selected.

(4) Cloning of rat somatostatin receptor protein subtype 4 (rSSTR4) DNA

DNA oligomers S4-3 and S4-4 were synthesized based on the known rat SSTR4 DNA sequence (Bito.H etal., J. Biol. Chem., 269, 12722-12730, 1994).

The sequence of S4-3 is 5'-AAGCATGAACACGCCTGCAACTC-3' (Sequence No. 3) and that of S4-4 is 5'-GGTTTTCAGAAAGTAGTGGTCTT-3' (Sequence No. 4).

As the template, a chromosomal DNA prepared from Sprague-Dawley rats by using Easy-DNA™ KIT (Invitrogen) was used. To 0.5 ng of said DNA was added 25 pmol of each of the above-mentioned DNA oligomers and the polymerase chain reaction was carried out using TaKaRa LAPCR KIT (TaKaRa).

The conditions of the reaction were as follows: One cycle consisting of the reactions at 95°C for 30 seconds, at 65°C for 2 minutes and 30 seconds, and 30 cycles were repeated. The reaction mixture was subjected to electrophoresis on 1% agarose gel to find that the DNA fragments of the intended size (about 1.2 kb) were specifically amplified. Said DNA fragments were recovered from the agarose gel in the usual manner and ligated to a vector (pCR™ 2.1 (Trade name)) of

ORIGINALTA CLONINGKIT (Invitrogen) to transform into the competent cells, *Escherichia coli* JM109. The transformant having plasmid containing said DNA fragments was selected out and the sequence of the inserted DNA fragments was confirmed by the automatic sequence analyzer employing fluorochroming, ALF DNA Sequencer (Pharmacia). As the results, the amino acid sequence expected from the nucleotide sequence was completely in agreement with the sequence described in the above-mentioned reports by Bito. H et al.

(5) Construction of the expression plasmid of rat somatostatin receptor protein subtype 4 (rSSTR4) DNA

pAKKO-111 was used as the expression vector in CHO cells. 5 μg of the plasmid having rat SSTR4 DNA fragment obtained above was digested with a restriction enzyme (EcoRI), treated with T4 DNA polymerase, and subjected to electrophoresis on 1% agarose gel to recover the 1.2 kb DNA fragment encoding rat SSTR4. Next, 1 μg of the above-mentioned expression vector pAKKO-111 (5.5 kb) was digested with a restriction enzyme (ClaI), treated with T4 DNA polymerase and Alikaline Phosphatase, to prepare the cloning site for insertion of rat SSTR4 DNA fragment. Said expression vector fragment and the 1.2 kb DNA fragment were ligated with T4 DNA ligase. The reaction mixture was introduced into *E. coli* JM 109 by the calcium chloride method to obtain the expression plasmid pA1-11-rSSTR4 in which rat SSTR4 DNA fragment was inserted in regular direction against the promoter from the transformants. This transformant is expressed as *Escherichia coli* JM109/pA-1-11-rSSTR4.

(6) Transfection and expression of rat somatostatin receptor protein subtype 4 (rSSTR4) DNA in CHO (dhfr$^-$) cells

1 x 10^6 CHO ($dhfr^-$) cells were cultured for 24 hours in α-MEM medium (containing ribonucleoside and deoxynucleoside) containing 10% bovine fetal serum on a laboratory dish of 8 cm in diameter. The cells were transfected by 10 μg of the rat SSTR4 DNA expression plasmid 1 pA-1-11-rSSTR4 obtained above using the calcium phosphate method (Cell Phect Transfection Kit; Pharmacia). The medium was switched to α-MEM medium (free of ribonucleoside and deoxynucleoside) containing 10% dialyzed bovine fetal serum 24 hours after the transfection to select the colony-forming cells (i.e. $dhfr^+$ cells) in this medium. Further, the selected cells were cloned from a single cell by the limiting dilution method and the somatostatin receptor protein expression activity of these cells was measured by the binding method mentioned above. Thus, a highly somatostatin-binding cell strain, rSSTR4-20-25, was selected.

(7) Preparation of CHO cell membrane fractions containing somatostatin receptor 4

Human and rat somatostatin receptor 4 expressing CHO cell strain, hSSTR4-1-2 or rSSTR4-20-25 (1 x 10^9) was floated on a phosphate buffered saline supplemented with 5 mM EDTA (PBS-EDTA) and centrifuged. To the cell pellets was added 10 ml of a homogenate buffer for cells (10 mM $NaHCO_3$, 5 mM EDTA, pH 7.5), which was homogenated using a Politron homogenizer. The supernatant obtained by centrifugation at 400 x g for 15 minutes was further centrifuged at 10,000 μg for 1 hour to give a precipitate of the membrane fraction. The precipitates were suspended in 2 ml of a buffer solution for assay [25 mM of Tris-HCl, 1 mM of EDTA (Ethylenediaminetetraacetic Acid), 0.1% of BSA (Bovine Serum Albumin), 0.25 mM of PMSF (Phenylmethylsulfonyl

Experimental Example 2

(1) Cloning of human somatostatin receptor protein subtype 1 (SSTR1) DNA

DNA oligomers S1-1 and S1-2 were synthesized based on the known human SSTR1 cDNA sequence (Proc. Natl. Acad. Sci., USA vol.89, p.251-255, 1992). The sequence of S1-1 is 5'-GGTCGACCTCAGCT AGGATGTTCCCCAATG-3' (Sequence No. 5) and that of S1-2 is 5'-GGTCGACCCGGGCTCAGAGCGTCGTGAT-3' (Sequence No. 6). Human chromosomal DNA (Clonetech Inc. Catalog No. CL 6550-1) was used as the template. To 0.5 ng of said DNA was added 25 pmol of each of the above-mentioned DNA oligomers and the polymerase chain reaction was carried out using 2.5 units of Pfu DNA polymerase (Stratagene). The composition of the reaction mixture was in accordance with the directions attached to said Pfu DNA polymerase. The conditions of the reaction were as follows: One cycle consisting of the reactions at 94°C for 1 minute, at 63°C for 1 minute and at 75°C for 2 minutes, and 35 cycles were repeated. The reaction mixture was subjected to electrophoresis on 1% agarose gel to find that the DNA fragments of the intended size (about 1.2 kb) were specifically amplified. Said DNA fragments were recovered from the agarose gel in the usual manner and ligated to pUC118 cleaved at the Hinc II site to transform into the competent cells, *Escherichia coli* JM109. The transformant having plasmid

containing said DNA fragments was selected out and the sequence of the inserted DNA fragments was confirmed by the automatic sequence analyzer employing fluorochroming, ALF DNA Sequencer (Pharmacia). As the results, the amino acid sequence expected from the nucleotide sequence was completely in agreement with the sequence described in the above-mentioned literature.

(2) Construction of the expression plasmid of human somatostatin receptor protein subtype 1 (SSTR1) DNA

pAKKO-111 was used as the expression vector in CHO (Chinese Hamster Ovary) cells. PAKKO-111 was constructed as follows: The 1.4 kb DNA fragment containing SRα promoter and poly A appositional signal was obtained from pTB1417 described in JP-A-H5 (1993)-076385 by treatment with Hind III and Cla I. On the other hand, the 4.5 kb DNA fragment containing dihydrofolic acid reductase (DHFR) gene was obtained from pTB348 [Biochem. Biophys. Res. Commun., 128, p.256-264, 1985] by treatment with Cla I and Sal I. These DNA fragments were treated with T4 polymerase to make the terminal blunt-ended and ligated with T4 ligase to construct pAKKO-111 plasmid. Then, 5 μg of the plasmid having human SSTR1 DNA fragment obtained under the above (1) was digested with the restriction enzyme Sal I and subjected to electrophoresis on 1% agarose gel to recover the 1.2 kb DNA fragment encoding human SSTR1. Next, 1 μg of the above-mentioned expression vector pAKKO-111 (5.5 kb) was digested with Sal I to prepare the cloning site for insertion of human SSTR1 DNA fragment. Said expression vector fragment and the 1.2 kb DNA fragment were ligated with T4 DNA ligase. The reaction mixture was introduced into *E. coli* JM 109 by the calcium chloride method to obtain the expression plasmid pA1-11-SSTR1 in which

human SSTR1 DNA fragment was inserted in regular direction against the promoter from the transformants. This transformant is expressed as *Escherichia coli* JM109/pA-1-11-SSTR1.

(3) Transfection and expression of human somatostatin receptor protein subtype 1 (SSTR1) DNA in CHO ($dhfr^-$) cells

1×10^6 CHO ($dhfr^-$) cells were cultured for 24 hours in HAM F12 medium containing 10% bovine fetal serum on a laboratory dish of 8 cm in diameter. The cells were transfected by 10 μg of the human SSTR1 cDNA expression plasmid 1 pA-1-11-SSTR1, obtained under the above (2) using the calcium phosphate method (Cell Phect Transfection Kit: Pharmacia). The medium was switched to DMEM medium containing 10% dialyzed bovine fetal serum 24 hours after the transfection to select the colony-forming cells (i.e. DHFR+ cells) in this medium. Further, the selected cells were cloned from a single cell by the limiting dilution method and the somatostatin protein activity was measured as follows: Human SSTR cDNA expression cell strain was diluted with a buffer solution for assay [50 mM of Tris hydrochloride, 1 mM of EDTA, 5 mM of magnesium chloride, 0.1% of BSA, 0.2 mg/ml of bacitracin, 10 μg/ml of leupeptin, 1 μg/ml of pepstatin and 200 units/ml of aprotinin (pH 7.5)] to adjust the cell number to 2×10^4/200 μl. 200 μl of the dilution was placed in a tube and to this was added 2 μl of 5 nM [^{125}I]-somatostatin-14 (2000 Ci/mmol, Amersham). The mixture was incubated at 25°C for 60 minutes. For measurement of non-specific binding (NSB), the tube to which 2 μl of somatostatin-14 (10^{-4} M) was added was also incubated. To the tube was added 1.5 ml of a buffer solution for washing [50 mM of Tris hydrochloride, 1 mM

of EDTA and 5 mM of magnesium chloride (pH 7.5)] and the mixture was filtered by GF/F glass fiber filter paper (Whatman) and washed further with 1.5 ml of the same buffer solution. The amount of [^{125}I] of the filter was measured by a γ-counter. Thus, a highly somatostatin-binding cell strain, SSTR1-8-3, was selected.

(4) Cloning of human somatostatin receptor protein subtype 2 (SSTR2) DNA

DNA oligomers PT-1 and PT-2 were synthesized based on the known human SSTR2c DNA sequence (Proc. Natl. Acad. Sci., USA vol.89, p.251-255, 1992). The sequence of PT-1 is 5'-GGTCGACACCATGGACATGGCGGATGAG-3' (Sequence No. 7) and that of PT-2 is 5'-GGTCGACAGTTCAGATACTGGTTTGG-3' (Sequence No. 8). Human pituitary gland cDNA (Clonetech Inc. Catalog No. 7173-1) was used as the template. To 1 ng of said cDNA was added 25 pmol of each of the above-mentioned DNA oligomers and the polymerase chain reaction was carried out using 2.5 units of Taq DNA polymerase (TaKaRa Shuzo). The composition of the reaction mixture was in accordance with the directions attached to said Taq DNA polymerase. The conditions of the reaction were as follows: One cycle consisting of the reactions at 94°C for 30 seconds, at 52°C for 20 seconds and at 72°C for 60 seconds, and 30 cycles were repeated. The reaction mixture was subjected to electrophoresis on 1% agarose gel to find that the DNA fragments of the intended size (about 1.1 kb) was specifically amplified. Said DNA fragments were recovered from the agarose gel in the usual manner and ligated to pUC118 cleaved at the Hinc II site to transform into the competent cells, *Escherichia coli* JM109. Two strains (No. 5 and No. 7) of the transformant having plasmid containing said DNA fragments were

selected out and the sequence of the inserted DNA fragments was confirmed by the automatic sequence analyzer employing fluorochroming, 373A DNA Sequencer (Applied Biosystem). As the results, point mutation was confirmed at one site between Sal I and Bst PI in the sequence of the 770 base fragment of No. 5 strain, and point mutation was also confirmed at one site between Bst PI and Sal I in the sequence of the 360 base fragment of No. 7 strain. Therefore, the fragments remaining after removing the Bst PI-Sal I fragment of No. 5 strain and the Bst PI-Sal I fragment of No. 7 strain were purified by electrophoresis on agarose to construct a plasmid in which these fragments were ligated by the ligation reaction. Confirmation of the insertion sequence of the DNA fragment of this plasmid revealed that it was completely in agreement with the sequence described in the above literature.

Next, 1 μg of the above-mentioned expression vector pAKKO-111 (5.5 kb) was digested with Sal I to prepare the cloning site for insertion of human SSTR2 DNA fragment. Said expression vector fragment and the 1.1 kb DNA fragment were ligated with T4 DNA ligase. The reaction mixture was introduced into *E. coli* JM 109 by the calcium chloride method to obtain the expression plasmid pAC01 in which human SSTR2

DNA fragment was inserted in regular direction against the promoter from the transformants. This transformant is expressed as *Escherichia coli* JM109/pAC-01.

The medium was switched to DMEM medium containing 10% dialyzed bovine fetal serum 24 hours after the transfection to select the colony-forming cells (i.e. $DHFR^+$ cells) in this medium. Further, the selected cells were cloned from a single cell by the limiting dilution method and the somatostatin receptor protein expression activity of these cells was measured by the binding assay mentioned under the above (3). Experimental Example 3

Measurement of the binding inhibition rate of ^{125}I-Somatostatin

The receptor binding inhibition rate (%) of the subject compound was calculated using each of the membrane fractions prepared in Experimental Examples 1 and 2.

The membrane fraction was diluted with a buffer solution for assay to adjust the concentration to 3 μg/ml. The diluate was placed in tubes each in quantity of 173 μl. To this were simultaneously added 2 μl of a solution of a subject compound in DMSO and 25 μl of a 200 pM radioisotope-labeled somatostatin-14 (^{125}I-somatostatin-14: Amersham). For measurement of the maximum binding, a reaction mixture added with 2 μl of DMSO and 25 μl of a 200 pM ^{125}I-somatostatin was prepared. For measurement of non-specific binding, a reaction mixture added with 2 μl of a 100 μM somatostatin solution in DMSO and 25 μl of a 200 pM ^{125}I-somatostatin solution was prepared at the same time. The mixtures were allowed to react at 25°C for 60 minutes. Then, the reaction mixture was filtered by aspiration using a

Whatman glass filter (GF-B) treated with polyethylenimine. After filtration, the radioactivity of ^{125}I-somatostatin-14 remaining on the filter paper was measured by a γ-counter. The binding inhibition rate (%) of each subject compound was calculated by the following formula:

(TB-SB)/(TB-NSB) x 100

SB: radioactivity when a compound was added

TB: maximum binding radioactivity

NSB: non-specific binding radioactivity

The binding inhibition rates were measured by changing the concentrations of the subject compound, and the 50% inhibiting concentration of the subject compound (IC_{50} value) was calculated by the Hill plots.

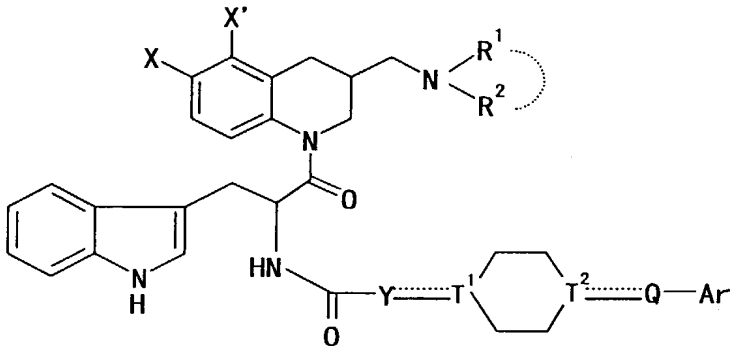
Abstract

A compound of the formula:



(I)

wherein X and X' are the same or different, and each represents a hydrogen atom, a fluorine atom, a chlorine atom or an amino optionally having substituents, and at least one of X and X' represents a fluorine atom, a chlorine atom or an amino optionally having substituents;

R^1 and R^2 represent a hydrogen atom or C_{1-6} alkyl optionally having substituents, or R^1 and R^2, together with the adjacent nitrogen atom, form a nitrogen-containing heterocyclic ring optionally having substituents;

Y and Q are the same or different, and each represents a bond or a spacer having a main chain of 1 to 6 atoms;

... represents a single bond or a double bond;

T^1 and T^2 are the same or different, and each represents $C(R^9)$ (R^9 represents a hydrogen atom, a hydroxy or C_{1-6} alkyl) or N, when each of the adjacent ... is a single bond, and C when the adjacent ... is a double bond; and

Ar represents an aromatic group optionally having substituents, a C_{3-9} cycloalkyl group optionally having

substituents, a 3 to 9-membered saturated heterocyclic group optionally having substituents, a hydrogen atom or a halogen atom; provided that 6-chloro-3-(R,S)-(N,N-dimethylamino)methyl-1-[3-(indol-3-yl)-2-[(R)-(4-phenylpiperazin-1-yl)carbonylamino]propanoyl]-1,2,3,4-tetrahydroquinoline; 6-chloro-3-(R,S)-(N,N-dimethylamino)methyl-1-[3-(indol-3-yl)-2-[(R)-4-(2-oxo-2,3-dihydro-1H-benzimidazol-1-yl)piperidinocarbonylamino]propanoyl]-1,2,3,4-tetrahydroquinoline and 1-benzoyl-N-[(R)-2-[6-chloro-3-[(N,N-dimethylamino)methyl]-1,2,3,4-tetrahydroquinolin-1-yl]-1-[3-(indol-3-yl)propanoyl]-4-piperidinecarboxamide are excluded; a salt thereof or a prodrug thereof has an excellent somatostatin receptor binding inhibition action and is useful for preventing and/or treating diseases associated with somatostatin.
